

WATERRA SURGE BLOCKS

The **Waterra Surge Block** is an excellent well development tool. It simply press fits over the body of the **Standard** or **High Flow foot valve (D-25 or D-32)**.

The **Waterra Surge Block** minimizes the annular gap between the foot valve and the well casing, surging and pumping simultaneously when the pump is operated. Developing wells in this manner is one of the best methods, often resulting in turbidity levels below 10 NTUs.

Waterra has surge blocks available for both 2" and 4" wells and for both the **Standard Flow** and **High Flow** systems. Please be sure to specify your preference when ordering.
